Understanding Dehydration Synthesis

What Is Dehydration Synthesis?

Dehydration synthesis, also known as condensation reaction, is a chemical process where two molecules are covalently bonded to form a larger molecule, with the concurrent removal of a water molecule. This process is fundamental in forming various biological macromolecules, such as carbohydrates, proteins, and nucleic acids.

Key points about dehydration synthesis:

- It involves the removal of a hydroxyl group (OH) from one molecule and a hydrogen atom (H) from another.
- The removal of these groups results in the formation of a new covalent bond.
- The byproduct of this reaction is a molecule of water (H_2O).

Example: The formation of a disaccharide like sucrose from glucose and fructose involves dehydration synthesis.

Importance in Biology

Dehydration synthesis is essential for constructing complex molecules necessary for life:

- Carbohydrate formation: Linking monosaccharides to form disaccharides and polysaccharides.

- Protein synthesis: Joining amino acids via peptide bonds.
- Nucleic acid assembly: Connecting nucleotides through phosphodiester bonds.

Understanding this process helps elucidate how living organisms build and maintain their molecular structures.

Common Half-Life Gizmo Questions and Solutions

Understanding typical questions can prepare students to navigate the Gizmo effectively. Below are some frequently encountered problems along with detailed solutions.

Question 1: Calculating Remaining Radioactive Material

Problem:

A sample initially contains 100 grams of a radioactive isotope with a half-life of 10 hours. How much remains after 30 hours?

Solution:

The decay follows exponential decay formula:

$$N = N_0 \times \left(\frac{1}{2}\right)^{t / T_{1/2}}$$

Where:

- $(N_0 = 100)$ grams
- $(T_{1/2} = 10)$ hours
- $(t = 30)$ hours

Calculations:

$$N = 100 \times \left(\frac{1}{2}\right)^{30/10} = 100 \times \left(\frac{1}{2}\right)^3 = 100 \times \frac{1}{8} = 12.5 \text{ grams}$$

Answer:

12.5 grams of the isotope remain after 30 hours.

Question 2: Determining the Half-Life from Data

Problem:

A sample of a radioactive material decays from 80 grams to 20 grams in 24 hours. What is its half-life?

Solution:

The decay from 80g to 20g involves two half-lives:

$[80 \rightarrow 40 \rightarrow 20]$

Number of half-lives: 2

Time for two half-lives: 24 hours

Therefore,

$$T_{1/2} = \frac{24 \text{ hours}}{2} = 12 \text{ hours}$$

Answer:

The half-life of the substance is 12 hours.

Question 3: Interpreting Decay Graphs

Problem:

Given a decay curve that shows the remaining amount of a substance over time, how can you estimate the half-life?

Solution:

Steps:

- Find the initial amount on the y-axis (N_0).
- Locate the point where the remaining amount is approximately half of N_0 .
- Trace horizontally from this point to meet the decay curve, then go vertically down to the x-axis.
- The corresponding time on the x-axis is an estimate of the half-life.

Tip:

Using gridlines or digital tools can improve accuracy.
